Prism evaluation 8 of 8

End-to-end processing and review routing

Core: workflow and review · Run 08 Nov 2026, 17:00 UTC · **All targets met**

What is measured

Whether every submitted claim passes through extraction, consolidation, policy analysis, and risk screening to a person, how long that takes, and whether each lands in the right queue: high risk to an investigator first, above INR 3,00,000 to a senior reviewer, everything else to a reviewer.

Data

The 25 claims loaded by prism.py demo-prepare, processed on one laptop with the real model and Temporal, several at a time.

Results

Measure	Result	Target	
Claims that reached a person after full processing	**24 / 25 (96.0%)**		
Claims routed to the right queue	**24 / 24 (100.0%)**	100%	**Met**
Submission to review, median	**3.6 min**		
Submission to review, 90th percentile	**24.6 min**		
Submission to review, fastest	**1.6 min**		
Risk summaries written	**16**		

Routing, claim by claim

Where the claims are now, after demo-prepare worked them

Status	Claims
Decided	11
In review	9
Awaiting information	3
Escalated	2

Observations

• Time is from submission to the first review task. Most of it is waiting for the model; the claims were processed concurrently, so each waited on the others.
• The slowest claim took 26.9 min. The slowest times include any claim whose processing failed (a model outage, say) and waited for someone to press Retry.
• A claim missing a required document does not reach a person until the document arrives or the 14-day wait expires; that is by design.

Limitations

• One local machine on one day. Times depend on the model provider's response times.

Reproduce

```
python -m uv run --project services/ai python scripts/prism.py demo-prepare
```
